This is the second in a series of two articles on Management of Work stress. The first article described causes, effects, risk assessment of work stress. This article describes Stress risk management and prevention of work stress.

Essential steps in Stress risk management
Risk management proceeds through a cycle of five actions:
• Analysis of the situation and risk assessment
• Design of an action plan to reduce the risk of work stress
• Implementation of the action plan
• Evaluation of the action plan
• Learning and further action based on the results of that evaluation

Basic Steps in Stress Risk Management
• Think about the different work groups or workplaces that make up the organization. Find out which are likely to be the most stressful.
• What evidence have you got for this? (e.g. high absence rates, poor health records, high accident rates, poor morale, worker or trade union complaints, poor productivity etc).
• Investigate the way in which the work of these groups or workplaces is designed and managed and examine their working conditions.
• Identify, collect and discuss the evidence that is available
• Work in a team with others who understand the work groups and workplaces. Consult the employees and trade unions possibly through group discussions.
• Identify the main problems and their effects.
• Discuss this information with the responsible superiors and other relevant people, such as Occupational Health specialists and trade unions.
• Develop an action plan that is appropriate, reasonable and practical.
• Discuss how this plan might be implemented and made to work. Inform the employees of the plan and how it will be implemented.
• Before its implementation, determine how this plan might best be evaluated.
• Implement and evaluate the action plan.
• Discuss the results of the evaluation. What can be learned from the successes and failures of the action plan? What can be done now?
• Revise action plan and implement a new one to target unaccounted risks.

Prevention of work stress
Primary prevention
• Ergonomics
• Work and environmental design
• Organizational and management development
Secondary prevention
• Worker education and training
• Developing more sensitive and responsive management systems and enhanced occupational health provision.
The organization itself is a generator of different types of risks. Tertiary prevention in organizations places an emphasis on the provision of responsive and efficient occupational health services. Contemporary work stress management should, therefore, encompass tertiary prevention.

Well-designed work should include:
• Employees should be provided with clear information about the structure, purpose and practices of the organization.
• Each employee’s skills, knowledge and abilities should be matched as much as possible to the needs of each job. Candidates for each job should be assessed against the job requirements. Suitable training should be provided where necessary.
• Effective supervision and guidance is important and can help protect staff from stress.
• A job description will depend on an understanding of the policy, objectives and strategy of the organization. It is important that an employee’s superiors are aware of the relevant details of the job and make sure that demands
are appropriate. The better the superior’s understanding of
the workers’ job, the more they will be able to direct the
appropriate efforts towards doing it well. Superiors should talk
to their staff, listen to them and make it clear that they have
been heard. Communication of work expectations should be
comprehensible, consistent with the job description and com-
plete. Commitments made to staff should be clear and should
be kept.
• A reasonable level of socializing and teamwork is often pro-
ductive as it can help increase commitment to work and to
the work group. In an existing workplace it may be far from
reasonable to expect all these factors to be present or intro-
duced where they are absent. It might therefore be better to
identify any mismatch between demands and pressures on
one hand and workers knowledge and abilities on the other.

Solving work stress problems

Work Redesign
The best strategies for work redesign focus on demands, knowl-
edge, abilities, support and control. These include:
• Changing the demands of work (e.g. by changing the way the
job is done or the working environment, sharing the work-
load differently).
• Ensure that employees have or develop the appropriate
knowledge and abilities to perform their jobs effectively (e.g.
by selecting and training them properly and by reviewing
their progress regularly).
• Improve employees’ control over the way they do their work
(e.g. job-sharing and more consultation about working prac-
tices).
• Increase the amount and quality of support they receive (e.g.
introduce ‘people management’ training schemes for superi-
or, allow interaction among employees, encourage coopera-
tion and teamwork).

Stress Management Training
• Classes on relaxation, time management, assertiveness train-
ing or exercise can be arranged for employees.

Ergonomics and Environmental Design
• Improve equipment used at work and physical working con-
ditions.

Management Development
• Improve superiors’ attitudes towards dealing with work
stress, their knowledge and understanding there of and
their skills to deal with the issue as effectively as possible.

Organizational Development
• Implement better work systems and management systems.
• Develop a more friendly and supportive culture.

Early detection and prevention of work stress-related problems:
• Regular monitoring of staff satisfaction and health.
• Making sure staff knows whom to talk to about problems.
• Knowing where to refer employees to for professional help
when they appear to be experiencing real difficulties (e.g.
doctors/counsellors)

It is essential to confirm the effectiveness of the measures taken
to correct work stress. Progress should be followed up after a
suitable period of time and compare initial assessment. If neces-
sary, the approach to work stress problem should be revised.

Caring for troubled workers
This is tertiary prevention to work stress. When all efforts to-
wards preventing work stress and controlling foreseeable risk
have failed, action should be taken swiftly and appropriately to
deal with workers who are being hurt by the experience of work
stress.

Steps of tertiary prevention of work stress:
• Work stress is usually revealed by observations of worker
difficulties or worker complaints of difficulties and ill health.
• Signs include irritability, aggression, errors, decreased per-
formance, increases in smoking, drinking and substance
abuse, higher levels of absenteeism and service recipient’s
complaints.
• Changes in workers’ behaviour or health should never be
ignored. When these signs coincide with excessive work pres-
sures or demands, workers may be suffering from work
stress.

What can be done to help employees with work-stress?
• The individual worker’s problems and the solutions to these
problems should be discussed with the worker and agreed
upon by all parties.
• Timing of such discussions may depend on worker’s state of
well-being.
• Possible interventions, both individual (e.g. training, medical
treatment, counselling) and organizational (e.g. job re-design,
changes in management practices) should be planned, imple-
mented and evaluated.

Records
• Careful records should be kept and progress should be evalu-
ated.
• Records should be accurate and should deal with facts and
points of evidence. Opinions and judgments should not be
represented as facts.
• Proposed actions and the reasons for their selections should
be agreed where possible and recorded.

Organizational culture
Organizational culture is reflected in the attitudes of staff and
their shared beliefs about the organization, their shared value
systems and common and approved ways of behaving at work.
Organizational culture also concerns how problems are recog-
nized and solved. It can affect what is experienced as stressful,
how that experience translates into health difficulties, how both
stress and health are reported and how the organization re-
ponds to such reports.

Employers, managers and trade union representatives must
therefore become aware of the culture of an organization, and
explore it in relation to the management of work stress. If neces-
sary, these parties must engage in culture change activities as an
important aspect of improving the management of stress at work.

Resources for managing work stress
All superiors should carefully consider the systems that they
have in place for assessing, preventing and otherwise managing
work stress. Superiors must be aware of the organization’s sys-
tems and resources for managing stress. Internal resources may
include occupational health services, human resource manage-
ment (personnel), training departments or other individuals with
the responsibility for staff well-being and health.

Individual problems which are complex, difficult and not man-
ageable internally are best dealt with by a psychologist, counsel-
lor or an occupational physician who may consult with other
specialist functions when necessary. Identification of any groups
at risk within the organization is crucial and should accompany
the examination of available organizational resources for manag-
ing work stress.
